| $\square$ | Question <br> Type 信 | Question $\downarrow \uparrow$ | A $\quad \downarrow \hat{}$ | B $\quad \downarrow \uparrow$ | C $\quad \\| \uparrow$ | D $ل$ 介 | Ansi |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\square$ | FBQ | If any matrix $A$ is transformed into another matrix $B$ by a series of elementary row operations，then A and B are $\square$ matrices． | equivalent |  |  |  |  |
| $\square$ | FBQ | $1+\frac{x}{1!}+\frac{x^{2}}{2!}+\frac{x^{3}}{3!}+\ldots \ldots .$ <br> is the $\square$ <br> series for $\exp x$ | Maclaurin＇s | maclaurin |  |  |  |
| $\square$ | FBQ | If the Lagrange＇s interpolation polynomial of $f(x)$ is given as $x^{3}-x^{2}+3 x+8,$ <br> then $f(2)=1$ is $\square$ | $8$ | eight |  |  |  |
| $\square$ | FBQ | Given that $f(3)=168, f(7)=120, f(3)=72$ and $f(10)=$ 63 ，the approximate value for $f(6)$ is $\square$ | 147 |  |  |  |  |
| $\square$ | FBQ | If $A B=B A=1$ ，then $A$ is the $\square$ of B | inverse |  |  |  |  |
| $\square$ | FBQ | $\square$ is the determinant of the system of equations： $\begin{gathered} 4 x_{1}+x_{2}+x_{3}=4 \\ x_{1}+4 x_{2}-2 x_{3}=4 \\ -x_{1}+2 x_{2}-4 x_{3}=2 \end{gathered}$ | $36$ |  |  |  |  |
| $\square$ | FBQ | Given that the Lagrange＇s interpolating polynomial $P(x)$ is given by $P(x)=L_{0}(x) f_{0}+L_{1}(x) f_{1}+L_{2}(x) f_{2}+L_{3}(x) f_{3}$ <br> Hence，If $f(1)=-3, f(3)=9, f(4)=30$ and $f(6)=132$ ， therefore Lagrange fundamental polynomial $L_{0}(x)$ <br> will be $\square$ | 7 | seven |  |  |  |
| $\square$ | FBQ | A matrix having the same number of rows and columns is called $\square$ matrix | square | Square |  |  |  |
| $\square$ | FBQ | A matrix in which all the non－diagonal elements vanish is known as $\square$ matrix． | diagonal |  |  |  |  |

| $\square$ | FBQ | A system of linear equations is said to be $\square$ if it has at least one solution. | homogeneous |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\square$ | FBQ | The transpose of the cofactor matrix of a square matrix $A$ is called the $\square$ of A | adjoint | Adjoint |  |  |  |  |  |
| $\square$ | FBQ | A matrix $\mathrm{A}=(\mathrm{aij})$ in which aij $=0(\mathrm{i}, \mathrm{j}=1,2 \ldots ., \mathrm{n})$ is called | NULL | Null |  |  |  |  |  |
| $\square$ | FBQ | Determinant is a number associated with $\square$ matrices. | square | Square |  |  |  |  |  |
| $\square$ | FBQ | A matrix $A$ is $\square$ if and only if it has a zero eigenvalue | singular |  |  |  |  |  |  |
| $\square$ | FBQ | The process of determining the value of $f(x)$ for a value of $x$ lying outside the interval $[a, b]$ is called $\square$ | extrapolation |  |  |  |  |  |  |
| $\square$ | MCQ | Iterative methods of the solutions of systems of equations are $\qquad$ | finite | infinite | sequential | non-sequential | B |  |  |
| $\square$ | MCQ | One of these is not a method of solving system of linear equations | Inverse method | elimination method | Determinant method | Solution method | D |  |  |
| $\square$ | MCQ | The following statements are true except | The backwarddifference form is suitable for approximating the value of the function at $x$ that lies towards the end of the table. | Stirling's method is used whenever interpolation is required of $x$ near the middle of the table of values. | $Forl; thel; centrall; differencel; formulas, ; the \;origin\; x_0\;,\; shouldl; not \(\backslash ;\) bel; chosen \;nearl; thel; pointl; beingl; approximated.I] &\begin{tabular}{l} The Stirling's interpolation is used for calculation when x lies between \} [x_0 - \|frac\{1\} \\ \{4\}hl;and \;x_0 + \frac\{1\}\{4\}h\|] \end{tabular} & C \\ \hline \(\square\) & MCQ & The following statements are true except & The divided difference is independent of the order of its arguments. & The identity matrix I is a diagonal matrix in which all the diagonal elements are equal to one & A square matrix is lower triangular if all the elements above the main diagonal vanish. & The divided difference is dependent of the order of its arguments. & D \\ \hline \(\square\) & MCQ & One of the following is not true & Two matrices A and \(B\) can be multiplied only if the number of columns of \(A\) equals the number of rows of B. & Addition of matrices is defined only for matrices of same order. & Two matrices A and \(B\) can be multiplied only if the number of columns of B equals the number of rows of A. & A square matrix is lower triangular if all the elements above the main diagonal vanish. & A \\ \hline \(\square\) & MCQ & The backward differences of order three \(\backslash\) [ \(\\) triangledown \(\wedge 3 \backslash\); of \(\backslash f(x) \backslash]\) is denoted by & \[Itriangledown \[ \begin{aligned} & \text { ^3 f_k }=\mathrm{f} \_\mathrm{k}- \\ & 3 \mathrm{f} \_(\mathrm{k}-2)-3 \mathrm{f} \_(\mathrm{k}- \\ & \text { 2) }-\mathrm{f} \_(\mathrm{k}-3) \mathrm{l} \end{aligned}$ |  <br> Itriangledown^3 <br> f_k = f_k-3f_(k- <br> 2) - 3f_(k-2) - <br> f_(k-3) \] | $\begin{aligned} & \backslash[\text { triangledown ^3 f_k } \\ & =\mathrm{f} \_\mathrm{k}-3 \mathrm{f} \_ \text {(k-2) - } \\ & \text { 3f_(k-2) - f_k } k] \end{aligned}$ | $\backslash$ \triangledown ^3 f_k $=\mathrm{f} \_\mathrm{k}-3 \mathrm{f} \_$(k2) - 3f_(k-2) -f_kl] | B |
| $\square$ | MCQ | The inverse of the matrix \[\begin\{pmatrix\} } 1  \&  2  \&  $3 \backslash 10$ \& 4 \& 5 $\ \backslash 0$ \& 0 \& 6lend\{pmatrix\};; is $\backslash ;$ $\qquad$ | \[1begin\{pmatrix\} 1 \& $\operatorname{\|frac}\{-1\}\{3\}$ \& \|frac $\{-1\}\{2\} \mid 10$ \& \|frac\{1\}\{4\} \& |frac\{-5\}\{24\}|10 \& 0 \& $\operatorname{lfrac}\{1\}$ \{6\}\|end\{pmatrix\}\}] | \[lbegin\{pmatrix\} <br>  <br>  <br>  <br>  <br> 0 \& $\operatorname{\text {frac}\{ 1\} }$ <br> \{6\}\|end\{pmatrix\}]] |  |  |  |  |  |
| lbegin\{pmatrix\} 1 \& \frac\{-1\}\{2\} \& \frac\{-1\} $\{12\} \backslash 10$ \& \|frac\{1\}\{4\} \& |frac $\{-5\}\{24\} \backslash 10$ \& 0 \& \frac\{1\} \{6\}lend\{pmatrix\}]] | \[lbegin\{pmatrix\} 1 <br>  <br> 3110 \& $\operatorname{\|frac}\{1\}\{4\}$ <br> \& $\operatorname{\|frac}\{-5\}\{24\} \backslash 10$ <br> \& 0 \& $\operatorname{\|frac}\{1\}$ <br> \{6\}lend\{pmatrix\}]] | C |  |  |  |  |  |  |  |
| $\square$ | MCQ | If the inverse of matrix $B$ exists, then it is .......... | universal | unique | united | unlimited | B |  |  |

| $\square$ | MCQ | Stirling's formula for interpolation is given by .............. | $\begin{aligned} & \backslash\left[P \_n(x)=f\right. \\ & \left(x \_0\right)+\text { \|frac\{s - } \\ & 1\}\{2\} \backslash \mid l e f t\left[d f \_1+\right. \\ & \text { d_(-lfrac\{1\} } \\ & \{2\}) \text { \|right] + } \\ & \text { \frac\{s^2\} } \\ & \left.\{2!\} d^{\wedge} 2 f \_0 \backslash\right] \end{aligned}$ |  | $\begin{aligned} & \backslash\left[P \_n(x)=f\left(x \_0\right)+\right. \\ & \backslash f r a c\{s\}\{2\} \backslash \text { eft[df_(1/2) } \\ & + \text { d_(-lfrac\{1\} } \\ & \{2\}) \mid \text { right] + \frac\{s^2\} } \\ & \left.\{2!\} d f \_0 \backslash\right] \end{aligned}$ | $\begin{aligned} & \text { }\left[P \_n(x)=f\left(x \_0\right)\right. \\ & +\backslash \text { frac\{s }\} \\ & \{2\} \backslash \text { left[df_(\|frac\{1\} } \\ & \{2\})+d \_(-\mid f r a c\{1\} \\ & \{2\}) \text { lright] + } \\ & \text { \frac\{s^2\} } \\ & \left.\{2!\} d^{\wedge} 2 f \_0 \backslash\right] \end{aligned}$ | D |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\square$ | MCQ | One of the following is true | $\begin{aligned} & \text { \[\|triangle ^3 f_4 } \\ & \left.=f \_4-f \_3 \backslash\right] \end{aligned}$ | $\begin{aligned} & \text { \[\|triangle ^} \wedge \text { f_4 } \\ & \left.=f^{\wedge} 4-f^{\wedge} 3 \backslash\right] \end{aligned}$ | \| [triangle ^3 f_4 = f_5 <br> -f_4] | \} [  triangle ^3 f_4 =  f_3 + f_4l] | A |
| $\square$ | MCQ | The inverse of a matrix $A$ is given by | $\begin{aligned} & \backslash\left[\mathrm{A}^{\wedge}\{-1\}=\backslash \operatorname{frac}\{1\}\right. \\ & \{\operatorname{det}(\mathrm{A})\} \operatorname{adj}(\mathrm{A}) \backslash] \end{aligned}$ | $\begin{aligned} & \backslash\left[\mathrm{A}^{\wedge}\{-1\}=\backslash \operatorname{frac}\{1\}\right. \\ & \{\operatorname{det}(\mathrm{A})\} \backslash] \end{aligned}$ | $\begin{aligned} & \backslash A=\backslash \operatorname{frac}\{1\}\{\operatorname{det}(A)\} \\ & \operatorname{adj}(A) \backslash] \end{aligned}$ | $\mathrm{A}=\operatorname{det}(\mathrm{A}) \operatorname{adj}(\mathrm{A})$ | A |
| $\square$ | MCQ | Theorem states that 'If $f$ is a continuous function defined on $[\mathrm{a}, \mathrm{b}]$ and differentiable on $] \mathrm{a}, \mathrm{b}[$; and If $f(a)=f(b)$, then there exists a number $\backslash\left[x \_\{0\} \backslash\right.$ in ]a, b[ $\backslash$;such $\$; that $\left.\backslash ; \mathrm{f}^{\prime}\left(\mathrm{x} \_\{0\}\right)=0 \backslash\right]$ | Pythagoras | Chebyshev | Rolle's | Lagrange's Mean Value | C |
| $\square$ | MCQ | The Lagrange's interpolating polynomial $\mathrm{P}(\mathrm{x})$ is given by $\qquad$ | $\begin{aligned} & \backslash\left[P(x)=L \_1(x) f \_0\right. \\ & +L \_0(x) f \_1+ \\ & L \_3(x) f f^{2}+ \\ & \left.L \_2(x) f \_3 \backslash\right] \end{aligned}$ | $\begin{aligned} & \backslash\left[P(x)=L \_0(x) f \_3\right. \\ & +L \_1(x) f \_2+ \\ & L \_2(x) f \text { f } 1+ \\ & \left.L \_3(x) f \_0 \backslash\right] \end{aligned}$ | $\begin{aligned} & l\left[P(x)=L \_0(x) f \_0+\right. \\ & L \_1(x) f \_1+L \_2(x) f-2 \\ & \left.+L_{-} 3(x) f \text { _ } 31\right] \end{aligned}$ | $\begin{aligned} & \backslash\left[P(x)=L \_0(x) f \_0+\right. \\ & L \_1(x) f \_2+ \\ & L \_2(x) f f^{2}+ \\ & \left.L \_3(x) f \text { f } 3 \backslash\right] \end{aligned}$ | C |
| $\square$ | MCQ | Solve the system of equations: $\backslash[a+b+c=1 \backslash] \backslash[4 a$ $+3 b-c=6 \backslash] \backslash[3 a+5 b+3 c=4 \backslash]$ | $\begin{aligned} & a=1 / 2 ; b=-1 ; c \\ & =-1 / 2 \end{aligned}$ | $\begin{aligned} & a=1 / 2 ; b=1 ; c \\ & =-2 \end{aligned}$ | $\begin{aligned} & a=1 ; b=1 / 2 ; c=- \\ & 1 / 2 \end{aligned}$ | $\begin{aligned} & a=1 / 2 ; b=1 ; c \\ & =-1 / 2 \end{aligned}$ | C |
| $\square$ | MCQ | $\backslash[$ The $\backslash$;interpolating $\backslash$;polynomial $\backslash$;of $\backslash$;degree $\backslash$ leq $n \backslash$; with\; thel; nodes $\left.\backslash ; x \_\{0\}, x \_\{1\}, \ldots, x \_\{n\} \backslash\right]$ can be written as | $\begin{aligned} & \backslash\left[P \_\{n\}(x)=\right. \\ & \text { } \operatorname{ssum\_ \{ k\|to~0\} ^{\wedge }\{ n\} } \\ & \operatorname{lfrac\{ f(x\_ \{ k\} )\} \{ } \\ & \left(x-x \_\{k\}\right) \\ & \left.\left.w^{\prime}\left(x \_\{k\}\right)\right\} \mid\right] \end{aligned}$ | $\begin{aligned} & \text { } \mid\left[P \_\{n\}(x)=\right. \\ & \text { } \left.\operatorname{ssum\_ \{ k\|to~} 0\right\}^{\wedge}\{n\} \\ & \operatorname{\|frac\{ f(x\_ \{ k\} )\} \{ } \\ & \left(x-x \_\{k\}\right) \\ & \left.\left.w^{\prime}\left(x \_\{k\}\right)\right\} \mid\right] \end{aligned}$ | $\begin{aligned} & \backslash\left[P \_\{n\}(x)=\right. \\ & w(x) \backslash \text { sum_\{k\|to } 0\}^{\wedge}\{n\} \\ & \backslash f r a c\left\{f\left(x \_\{k\}\right)\right\}\{(x- \\ & \left.\left.\left.\left.x \_\{k\}\right)\left(x \_\{k\}\right)\right\}\right\}\right] \end{aligned}$ | none of the above | A |
| $\square$ | MCQ | Find the inverse of the matrix $\[$ begin\{pmatrix $\}$ \& 2 \& $3 \backslash 10$ \& 4 \& $5 \backslash \backslash 0$ \& 0 \& 6lend\{pmatrix $\} \backslash]$ | \[1begin\{pmatrix\} $1 \& 2 \& 3 \backslash 1 \mid 0 \& 4$ \& 5110 \& 0 \& 6lend\{pmatrix\}\}] & \[lbegin\{pmatrix\} $1 \&-1 / 2$ \& \|frac\{-1\}\{12\}||0 \& |frac\{1\}\{4\} \& |frac\{-5\}\{24\}|\0 \& 0 \& lfrac\{1\} \{6\}\end\{pmatrix\}\}] } & <br>  <br> \|frac\{1\}\{2\} \& |frac\{3\} <br> $\{0\} \& 4 \&$ \|frac\{5\} <br>  <br> 6lend\{pmatrix\}\}]&\[lbegin\{pmatrix\} 1 \& 2 \& $\operatorname{\text {frac}\{ 1\} }$ <br> $\{12\} \backslash 10$ \& $4 \&\{5\}$ <br>  <br> \frac\{1\} <br> \{6\}\|end\{pmatrix\}\}] & B \hline $\square$ & MCQ & $1Delta^2 f_k= .........)] & \(\backslash\left[f \_\{k+1\}-\mathrm{f} \_\mathrm{k} \mid\right]\) & \[lDelta f_\{k+1\}\Delta f_kl] & \[ \begin{aligned} & \text { \[ } \\ & \left.f \_\{k+2\}-2 f \_\{k+1\}+f \_k \mid\right] \end{aligned}$ | All the options | D |  |  |
| $\square$ | MCQ | $\backslash\left[L e t \mid ; ; ; x \_0, x \_1, \ldots x \_n \backslash\right] b e(n+1)$ distinct points on the real line and $f(x)$ be a real-valued function defined on some interval $\mathrm{I}=[\mathrm{a}, \mathrm{b}]$ containing these points, then $\qquad$ | there exists more than one polynomial of degree $n$ | there exists exactly one polynomial of degree $n$ | there exists two polynomials of degrees n and $\mathrm{n}+1$ | no polynomial of degree n exists | B |
| $\square$ | MCQ | A system of linear equations is said to be $\qquad$ if not all its right hand side is zero | consistent | inconsistent | homogeneous | nonhomogeneous | D |
| $\square$ | MCQ | The eigenvalues of a diagonal matrix are ......... | 0 \& 1 | the diagonal elements themselves | all zeroes | all unity | B |
